

Bees belong to one of the smaller insect families, but there are still almost 20,000 species of bees. Some of them travel in swarms. Some travel alone. Not all of them make honey, but all of them are important for pollinating plants.

A Home for a Bee

Honeybees build honeycombs out of wax to store their honey. They also use some of the cells in the honeycomb as nests for their eggs and larvae. Draw an egg or a larva in each of the cells below and color the picture.

Note: honeycombs are mostly yellow, but bee larvae and eggs are white.
